

Data Sheet; Water Filter Cartridge Classic Drinking Water Cartridge

The removal of organic chemicals, chlorine taste and odour combined with heavy metal removal

The 'Scale Specialist' is designed for use in the;

- Fountain filtration system;
- Spring Countertop filter.

How does it work?

The ceramic barrier removes 99.99% of all particles above 1 micron including harmful bacteria, parasites and sediment. The special ceramic cartridge contains a carbon block which absorbs and clings to impurities, including chlorine, pesticides, herbicides, volatile organic chemicals and more to its fine pore structure up to 20 times more efficiently than GAC. The Classic drinking water cartridge has an extra element for the removal of lead.

Do I need to remove Organics, Chemicals, Chlorine Taste and Odour and Lead?

Yes, Heavy metals are toxic and cause, amongst others, hypertension, strokes and heart disease in adults and in children learning difficulties and behaviour problems. It removes Synthetic Organic Chemicals (SOC), Volatile Organic Chemicals (VOC), Trihalomethanes (THM) and known carcinogens. Their taste and odour are just plain unpleasant.

Do I need to remove calcium?

No, calcium is good for teeth and bones and is good for health reasons. However, we do understand that, cosmetically, it is not pleasing. (When the calcium carbonate precipitates out of the water at 70° Celsius the temporary hardness goes from solution to its visual solid state. This is seen as scale in kettles and scum when mixed with milk and the oil, flavourings and tannins in tea and coffee etc.) The Classic drinking water filter cartridge retains the healthful calcium and magnesium in your drinking water.

Where do I purchase the cartridge?

From ItDoesTheJob.com. If you are an existing customer, we can set up a reminder system to notify you that your cartridge needs changing after a fixed period of time.
