

## Doulton CleanSoft® Data Sheet

The removal of temporary hardness and reduction of limescale.

The Doulton CleanSoft® Cartridge will reduce scale & scum from drinking water supplies but will retain healthful minerals. The Doulton CleanSoft® is suitable alongside an existing water filtration system.

### How does it work?

The Doulton CleanSoft® removes temporary hardness by transforming the Calcium ions in to Calcium bonds, these bonds unlike the ions are stable and can not attach to any surfaces, therefore removing the build up a limescale.

### Do I need to remove scale and scum?

No, calcium is good for teeth and bones and is good for health reasons. However, we do understand that, cosmetically, it is not pleasing. (When the calcium carbonate precipitates out of the water at 70 C the temporary hardness goes from solution to its visual solid state. This is seen as scale in kettles and scum when mixed with milk and the oil, flavourings and tannins in tea and coffee etc.).

### When will the cartridge need changing?

It is recommended that the cartridge be replaced on a period of every 6 months, however this is dependant on the quality of water.

### Warning:-

A) There can be a great variance from day to day in hardness from one area to another.  
B) The cartridge is designed to only remove temporary hardness not permanent and thus the proportion of temporary hardness and permanent hardness varies although the total hardness may remain the same.

### Where do I purchase the cartridge?

From ItDoesTheJob.com. If you are an existing customer, we can set up a reminder system to notify you that your cartridge needs changing after a fixed period of time.
