

Data Sheet; Water Filter Cartridges 'Sapphire' (A) Data Sheet Removal of Arsenic

The 'Sapphire' cartridge is suitable with:

- Gravity Filters
 - Spring Countertop Filters
- All in line filter housings

What does it remove?

This cartridge has an ABS polymer shell packed with the unique ferric oxide media to remove arsenic from your drinking water. The media uses no chemicals and never needs cleaning.

How does it work?

The special disposable cartridge uses a patented system to deliver consistent, guaranteed performance. The contaminated water passes through the robust granular ferric oxide media and the arsenic is adsorbed and removed to a level below the drinking water standard of 10 micrograms per litre. This highly efficient media wastes less than 0.1% of your water compared to up to 25% for other technologies.

When will the cartridge need changing?

Your A-25-OE cartridge will need replacing approx. every 12 months. Depending on the concentration of arsenic in the raw water this cartridge will effectively remove arsenic for over 36,600 litres of water @ 2 ltr/min.

What happens to the old cartridge?

The cartridge is easily disposable and no hazardous waste is generated as tested by TCLP (Toxicity Characteristic Leaching Procedure), so there is no costly disposal.

After your purchase

You can automatically be added to a cartridge reminder. When your cartridge is up for renewal, a member of our staff will give you a friendly call and remind you that it is time to change your cartridge.
